No se alcanzó la tolerancia en el número máximo de iteraciones.
```

```
biseccion_5 = metodo_biseccion(f_5,0,0.48,max_iter=10)
```

Resolviendo el intervalo [0,0.48] con tolerancia 0.0001

El método de Newton es generalmente considerado el más eficiente debido a su rapidez y eficiencia en la reducción del error. Este método converge rápidamente hacia la solución, lo que lo convierte en una opción ideal cuando se dispone de un buen valor inicial. Sin embargo, si no contamos con un valor inicial adecuado, el método de la secante puede ser más apropiado. Aunque este método puede requerir más iteraciones, tiene la ventaja de no necesitar el cálculo de la primera derivada de la función. Finalmente, el método de la bisección, aunque fiable, es comparativamente más lento que los otros dos métodos.

## Ejercicio 6

La función descrita por () =  $\ln(2+1) - 0.4 \cos$  tiene un número infinito de ceros.

- a. Determine, dentro de 10-6, el único cero negativo.
- b. Determine, dentro de 10-6, los cuatro ceros positivos más pequeños.
- c. Determine una aproximación inicial razonable para encontrar el enésimo cero positivo más pequeño de . [Sugerencia: Dibuje una gráfica aproximada de .]
- d. Use la parte c) para determinar, dentro de 10-6, el vigesimoquinto cero positivo más pequeño de

```
# Literal A

def f_6(x):
